## Flux and Flux-Frequency Measurements and Standardization in Magnetic Recording

By JOHN G. McKNIGHT

In order to have interchangeable tape recordings, standards are needed for flux-frequency response and for the absolute value of the recorded flux. It is shown that the recorded signal is best measured and specified as the "shortcircuit flux per unit track width"; measurements techniques are reviewed. The need for equalization and the division into recording and reproducing equalization are developed. Standard equalizations of many organizations are shown as flux-frequency responses. Standard reference fluxes and operating levels are tabulated and discussed. The terms necessary for response and level standardization are proposed and defined and, since terms are not defined in presently published standards, those defined here are compared with usages of the standards.

Table III. Flux-Frequency Response Currently Specified by Various Standardizing Organizations: Summary of Transition Frequencies and Time Constants.

|       | _    | Transition frequencies 10 |                  | Equivalent<br>time con-<br>stants <sup>10</sup> |                  |  |
|-------|------|---------------------------|------------------|---|------------------|--|
| Speed |      | $f_l$                     | f <sub>h</sub> , | t <sub>1</sub> ,                                | t <sub>h</sub> , | Standardizing  |
| cm/s  | in/s | Hz                        | Hz               | μs  | μs               | organization   |
| 76    | 30   | 0                         | 9000             | 80  | 18               | Ampex professional equipment   |
|       |      | 0                         | 4500             | ω   | 35               | CCIR (1953 or earlier to 1966); IEC (1968); DIN (1962)                                       |
| 38    | 15   | 50                        | 3150             | 3180  | 50               | NAB (1953 and 1965); EIA (1963)  |

<sup>\*</sup> ω- and 100-μs were formerly used by CCIR, IEC and DIN.

This paper is a revised version of "Absolute flux and frequency-response characteristics in magnetic recording," Jour. Audio Eng. Soc., 75: 254–272, July 1967; submitted as a contribution on December 19, 1968, by John G. McKnight, Ampex Corp., Consumer and Educational Products Group, P.O. Box 1166, Los Gatos, Calif. 95030. Revised April 7, 1969.

b 3180- and 200-us formerly used by Ampex (1953-1958).

<sup>° 3180-</sup> and 140-µs formerly used by IEC (1964).

<sup>10.</sup> The transition frequencies have all been rounded to the nearest "preferred frequency", according to USA Standard S1.6-1967. Where "time constants" are given, these are the exact values given in standards.
